

ESADE Capstone Project

Classical ML vs. LLM for Credit Scoring (offline simulation + explainability)

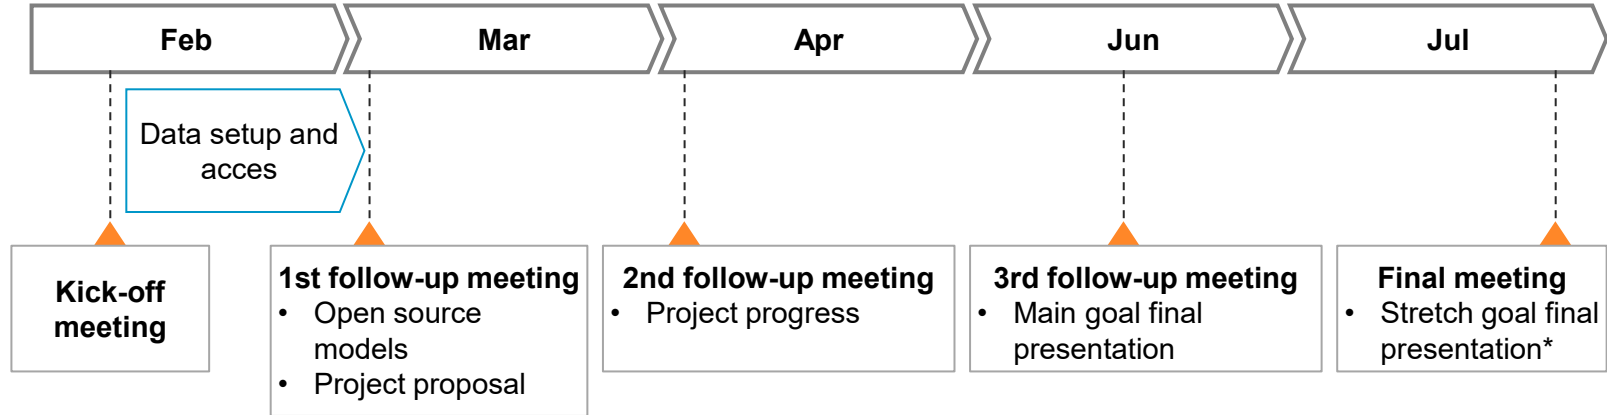

Classical ML vs. LLM for Credit Scoring (offline simulation + explainability)

Project highlines

- Compare a traditional ML model (e.g., Gradient Boosting) with an LLM “reasoned decision” produced via prompting on anonymized or synthetic credit files.
- Measure AUC/F1, stability, and cost, and contrast explainability approaches (SHAP vs. LLM rationales)
- Emphasize regulatory constraints: offline prototyping only and risk/explainability analysis, with no production use.

Expected timeline

Frequent interactions between students and mentor will be required to solve small issues as fast as possible

*Final presentation will take place in Banc Sabadell Headquarters, in Sant Cugat del Vallès.
